                                                                                                                                                                                                                                                                                    hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis.
                                                                                                                                                                                                                                                                                                                                                                                        control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human c-raf gene, resulting in c-raf express inhibition. The present sequence may be useful for treating and raf-associated cell hyperproliferation conditions such as cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human rat useful for utaymosts, tacumum proliferative conditions such as cancer, psoriasis restenosis

```
AAT27521-T27534 are antisense oligonucleotides against both rat and mouse c-raf kinase. They can be used for the inhibition of raf expression. The oligonucleotides (ONs) are targeted to either coding region, start signal or 5' or 3' untranslated region (UTR) mRNA encoding mouse/rat c-raf. The ONs are phosphorothioate linked. The ON are used to inhibit expression of rat and mouse raf. The ONs can be used in particular accounts of the one of the constant of the constant of the one of the constant of the one of the constant of the constan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligo:nucleotide(s) targetted to nucleic acids encoding capable of inhibiting raf expression, used in treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and raf-associated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense ollogonucleotide. This sequence is targeted to mouse and rat c-raf genes, resulting in c-raf expression inhibition. The present sequence may be useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human raf useful for diagnosis, treatment of raf-associated proliferative conditions such as cancer, psoriasis or blood restenosis

The present sequence was used in the development of a novel method for the detection of one or more protein protein interactions. The method can be used for comparative analysis of protein-protein interactions that occur in two or more different tissue/cell-types, disease states or stages of development. The genes encoding the proteins involved in these interactions, can be identified and isolated rapidly. The method can also be used for concurrent identification of inhibitors of the protein-protein interactions.

                                                                                                                                                                                                                                                                                                          The present sequence was used in the development of a novel method for the detection of one or more protein-protein interactions. The method can be used for comparative analysis of protein-protein interactions that occur in two or more different tissue/cell-types, disease states or stages of development. The genes encoding the proteins involved in these interactions, can be identified and isolated rapidly. The method can also be used for concurrent identification of inhibitors of the protein-protein interactions that characterise a given population, and which have therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1998-052326/05.

                                                                                                                                               The present invention relates to methods for detecting and isolating genes encoding proteins that interact with each other, via the reconstitution of a transcription factor and hence reporter gene activation. Proteins are fused to either the yeast DNA-binding domain of a transcriptional activator or to the activation domain of a transcriptional activator. The present sequence is a PCR primer used in the present invention to amplify yeast fusion genes. The present method may be used to identify protein-protein interactions and genes encoding
                                                                                                                                                                                                                                                                                        Detecting protein-protein interactions in protein populations useful for identifying genes encoding the proteins, and inhibitors of the interactions, by detecting transcriptional regulation leading to reporter gene activation
                                                                                                                                                                                                                                                                                                                                                         WPI;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapy. The products can be used in a method of radiosensitising tumour tissue by addition of an antisense oligonucleotide of maximum 40 bases containing ODN/Oligo. The liposome carrier system directly targets tumour tissue and has the potential for use in the radiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the nucleotide sequence of the human antisense c-raf-1 oligodeoxyribonucleotide (ODN/Oligo), used in the method of the invention to directly target tumour tissue, and in cancer radiation therapy. The products can be used in a method of radiosensitising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New cationic liposome composition containing raf oligodeoxynucleotide - can be used to directly target tumour tissue and is useful in the radiation therapy of cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (GEOU
                                                                                                                                                                                                              (INEX-) INEX PHARM CORP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          intermediate mixture of lipid-encapsulated particles, and changing the pH of the mixture to neutralise at least some of the external surface charges on the particles. One lipid has a (de)protonatable group with Ka such that the lipid is charged at a first pH but neutral at a second pH (particularly near physiological pH) and the buffer maintains this lipid in the charged form (i.e. cationic when the therapeutic agent is anionic in the buffer, or vice versa). The second lipid prevents particle aggregation during formation of the lipid-therapeutic agent particles. The composition is used to introduce therapeutic agents into cells, in vivo or in vitro, particularly to treat or prevent diseases associated with aberrant gene expression in mammals, specifically tumours, infortion of fortions.

The oligonucleotide can have either phosphorothicate or phosphodiester bonds. The oligonucleotide is lipid-encapsulated using the method of the invention. A composition comprising lipid-encapsulated particles of a therapeutic agent,

The oligonucleotide is used in a method for delivering lipid encapsulated therapeutic agents (i.e antisense oligonucleotides) to mammals. The lipid capsule comprises steric barrier lipids that prevent particle aggregation during lipid nucleic acid formation. The method may be used for the delivery of therapeutic agents to mammalian cells. It is especially suitable for
                                                                                                                                                                                                                                                                                                 distearoylphosphatidylcholine; palmitoyloleoyl phophatidylcholine; DSPC; POPC; 1,2-dioleoyl-sn-3-phosphoethanolamine; cholesterol; SM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   therapeutic agents to mammalian cells. It is especially suitable for delivering nucleic acid molecules, and in particular antisense molecules which may be administered to down regulate the expression of aberrant

cc encapsulated in the lipid portion. The lipid portion comprises a first clipid component selected from lipids containing a protonatable or component selected from lipids containing a protonatable or cdeprotonatable (preferably protonatable) group that has a pKa such cthat the lipid is in charged form at a first pH and in neutral form at camponent is further selected such that the charged form at component is related such that the charged form is cationic component is selected from lipids that prevent particle aggregation component is selected from lipids that prevent particle aggregation cduring lipid-therapeutic agent particles formation and which exchange cout the lipid particle at a rate greater than PEG-cer20; third lipid component is a neutral lipid selected from distearcylphosphatidylcholine (pSPC), palmitoylolecyl phophatidylcholine (pSPC), 1,2-diolecyl-sn-3-cc (DSPC), palmitoylolecyl phophatidylcholine (pSPC), 1,2-diolecyl-sn-3-cc (DSPC), palmitohis cholesterol. Compositions of the invention are used component which is cholesterol. Compositions of the invention are used component which is cholesterol. Compositions of the invention are used conformation growth factor 1-receptor), vas. raf, erb-B-2, PKC-alpha (phosphokinase C-alpha), IGF-IR (creeptor), vas. raf, erb-B-2, PKC-alpha (phosphokinase C-alpha), IGF-IR (creeptor), very and very receptor), bcl-2, EGFR (epidermal growth factor creeptor), very and very resent sequence is an antisense oligonucleotide confectious disease. The present sequence is an antisense oligonucleotide cargetted to human c-raf-1 protein kinase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tumours. The composition comprises lipid-therapeutic agent particles comprising a lipid portion and a charged therapeutic agent which is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expression. The oligonucleotides (ONs) are targeted to either coding region, start signal or 5' or 3' untranslated region (UTR) mRNA encoding mouse/rat c-raf. The ONs are phosphorothicate linked. The ON are used to inhibit expression of rat and mouse raf. The ONs can be used in partic. in conditions associated with hyperproliferation e.g.
abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf express Sequences Z115511-564 represent antisense oligonucleotides for mou
                                                 The invention provides antisense oligonucleotides targeted to mRN encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing
                                                                                                                                Disclosure; Column 15;
                                                                                                                                                                     expression

A method has been developed for the identification of a nucleic acid CC capable of modulating a process in a biological system. The method CC capable of modulating a process in a biological system. The method CC comprises: (a) introducing into the system a random library of nucleic CC carid catalysts (NAC) having a substrate binding domain (SBD), comprising CC arandom sequence, and a catalytic domain (CD); and (b) identifying NAC CC in systems where modulation has occurred and/or determining the sequence CC of at least part of the SBDs in such systems. Nucleic acid moleculess CC with endonuclease activity and catalytic activity, from the present CC invention, are used to modulate gene expression in plant and mammalian CC cells and to cleave target nucleic acid, particularly for treating CC systemic diseases caused by specific RNA, e.g. cancer, inflammation, CC psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine CC craf RNA. Specifically NACs with RNA-cleaving activity that modulate C expression of the Raf gene, are used to treat cancer, restenosis, CC psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications CC increases stability against nuclease and activity. AAV99922 to AAV93877
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-AUG-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local
                                                                                                                                                                                                                                AAT27481-T27507 are human c-raf kinase antisense oligonucleotides use for the inhibition of raf expression. The oligonucleotides (ONs) are targeted to either coding region, start or stop signal or 5' or 3' untranslated region (UTR) mRNA encoding human c-raf. The ONs may be phosphorothicate linked and may contain modifications at the 2' position of the sugar modety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothicate linked and contain 2'-O-alkyl sugar modifications. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligo:nucleotide(s) targetted to nucleic acids encoding capable of inhibiting raf expression, used in treatment
                                                                                                                                                                          Sequence

The present sequence represents a specifically claimed oligonucleotide for use in the composition. The composition can be used to treat mammalian cancer, especially human lung, stomach, renal, breast, laryngeal, pancreatic or colorectal cancer, or malignant melanoma. The anionic polysaccharide increases tumour uptake of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      stabilised liposomes are claimed. The compsns. can be used for inhibiting the expression of human raf. They can be used for the treatment of mammalian cancer, partic, human cancer e.g. lung, stomach, renal, breast, laryngeal, pancreatic, colorectal cancer and malignant melanoma. In particular the compsns. can inhibit abnormal raf expression and retain anti-hyperproliferative activity after prolonged circulation in the bloodstream. They facilitate the reduction of accumulation of ONs in non-target organs and a reduction of acute and chronic side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting human raf expression, partic. for treating causing an oligonucleotide targeted to mRNA encoding human entrapped in sterically stabilised liposome(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                           during prolonged treatment. ON1-10 are oligodeoxynucleotides with phosphorothioate backbones designed using the Genbank c-raf sequence HUMRAFR. ON1 is targeted to the translation initiation site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T59716-28 are preferred oligonucleotides which are targeted to mRNA encoding human raf and are capable of inhibiting raf expression compositions containing the oligonucleotides entrapped in sterically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Key

The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf expression. Sequences AAZII511-53 and AAZII555-573 represent antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    position Fighter 0.825 on the human chromosome 20; and (11) detecting the binding of the probes to the target sequence 20; and (11) detecting the capital sequences to which the probes can hybridise. These nucleic acid sequences also represent PCR primers. The probes and method can be used to detect genomic amplifications in the 20q13 (especially the 20q13.2) amplicon, which is associated and indicative of the presence of a large number of cancers, e.g. primary tumours of breast, ovary, bladder, head and neck and colon cancers. The method uses the technique of comparative genome hybridisation (CH) which is able to reveal amplifications and deletions in genomic chromosomes irrespective of genome rearrangements. However CGH also provides a more quantitative estimate of copy number than, e.g. Southern hybridisation, and also provides the localisation of the amplified or deleted region in a normal chromosome. Fluorescent in situ hybridisation was further performed using locus specific probes to confirm the CGH data and to precisely map the region of the amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

A method has been developed for detecting chromosomal abnormalities at CC about position Flpter 0.825 on the human chromosome 20. The method CC comprises: (1) contacting a chromosomal sample from a patient with at CC least 1 labelled probe, which binds to a target sequence at about 20 position Flpter 0.825 on the human chromosome 20; and (ii) detecting the 20 position Flpter 0.825 on the human chromosome 20; and (ii) detecting the 20 position Flpter 0.825 on the human chromosome 20; and (ii) detecting the 20 position flpter of the 20 position probes to the target sequence. AAX16549 to AAX16586 crepresent nucleic acid sequences to which the probes can hybridise. These nucleic acid sequences to which the probes can hybridise. These can be used to detect genomic amplifications in the 20 probes and method can be used to detect genomic amplifications in the 20 probes and method can be used to detect genomic amplification in the 20 probes and method can be used to detect genomic ancers. The method uses the technique of can be used to detect and colon cancers. The method uses the technique conformative genome hybridisation (CGH) which is able to reveal amplifications and deletions in genomic chromosomes irrespective of comparative genome hybridisation (CGH) which is able to reveal amplification be compared to compare than, e.g. Southern hybridisation, and also crowides the localisation of the amplified or deleted region in a normal company to the region of the amplification was further performed contant probability of the probes to confirm the CGH data and to precisely many the region of the amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 2; Page 14; 40pp; English.
                                                                  the region of the amplification.
